

ESSBASE HYBRID AGGREGATION MODE

North Texas Hyperion User Group - November 13, 2014

- Introduction to Essbase Storage Options
- Hybrid Aggregation Mode
 - Benefits of Hybrid Aggregation Mode
 - Enabling Hybrid Aggregation Mode
 - Current Limitations
 - How to Avoid Disaster
 - Demo (**RedBox Retail Locations**)
- Q&A

- **Block Storage Option (BSO)**
 - The “original” Essbase storage option
 - Supports advanced procedural calculations
 - Supports sending data to parent levels
 - Limited support for cubes with many or very large dimensions

- **Aggregate Storage Option (ASO)**
 - Introduced in Essbase version 7.1.2
 - Supports cubes with many large dimensions
 - Less mature support for complex procedural calculations
 - Does not support sending data to parent levels

- **Hybrid Aggregation Mode**

- Introduced with Essbase 11.1.2.3.500 with limited functionality
- Optional feature applied to Block Storage (BSO) cubes
- BSO cube with ASO style calculations
- Attempts calculations using Hybrid, but if the conditions aren't just right, defaults back to Block Storage mode
- Supports sending data to parent levels, as long as they aren't dynamic
- Supports advanced procedural calculations
- Not to be confused with "Hybrid Analysis"

HYBRID AGGREGATION MODE

ASO-Style

✓ Dynamic Sparse Members

BSO

✓ Stored Sparse Members

** Which engine calculates dynamic dense members?

- **Reduces the need to calculate and store certain data during batch calculations resulting in (as compared to BSO):**
 - **Faster Batch Times**
 - **Lower Disk Space Requirements**
 - **Faster Database Restructures**
 - **Increased Application Availability**
 - **Instantly Aggregated Data**

- **Brand New Technology**
- **Documentation Limited to .500 Patch Readme File**
- **Significant Calculation Limitations**
- **Calc scripts that reference data from dynamic sparse member combinations can be very slow.**
- **Calculations that fail to meet the Hybrid engine's requirements default to Block Storage mode and can be very slow.**
- **Necessitates the use of query governors**

- **Three Key Steps:**
 - 1) **Build BSO Cube**
 - 2) **Modify Essbase Config File**
 - 3) **Make Sparse Members Dynamic**
- **Load . . . Calculate . . . Retrieve**
- **Test**

ENABLING HYBRID AGGREGATION MODE

Requires a setting in the **Essbase.cfg** file.

```
Essbase config settings (essbase.cfg)
; The following entry specifies the full path to JVM.DLL
; JvmModuleLocation $J(EPM_ORACLE_HOME)\..jdk160_35\jre\bin\server\jvm.dll
BPM_Oracle_DriverDescriptor "DataDirect 7.0 Oracle Wire Protocol"
BPM_DB2_DriverDescriptor "DataDirect 7.0 DB2 Wire Protocol"
BPM_SQLServer_DriverDescriptor "DataDirect 7.0 SQL Server Native Wire Protocol"
;BPM_SQLServer_DriverDescriptor "SQL Server"
;BPM_Netezza_DriverDescriptor "NetezzaSQL"
BPM_Teradata_DriverDescriptor "Teradata"
;BPM_ORACLEBI_DriverDescriptor "Oracle BI Server 11g_OHXXXX"
;BPM_ORACLEBI_DriverDescriptor "Oracle BI Server"
BPM_MySQL_DriverDescriptor "DataDirect 7.0 MySQL Wire Protocol

AuthenticationModule CSS

SERVERPORTEND 33768
AGENTDESC hypservice
ASODYNAMICAGGINBSO HYB_RB PARTIAL
```

ASODYNAMICAGGINBSO [app [db]] NONE | PARTIAL | FULL

- Can be enabled or disabled for specific applications
- Can be enabled or disabled for specific databases within applications
- Can be disabled for the entire server
- Can be enabled in **Partial** or **Full** mode

ENABLING HYBRID AGGREGATION MODE

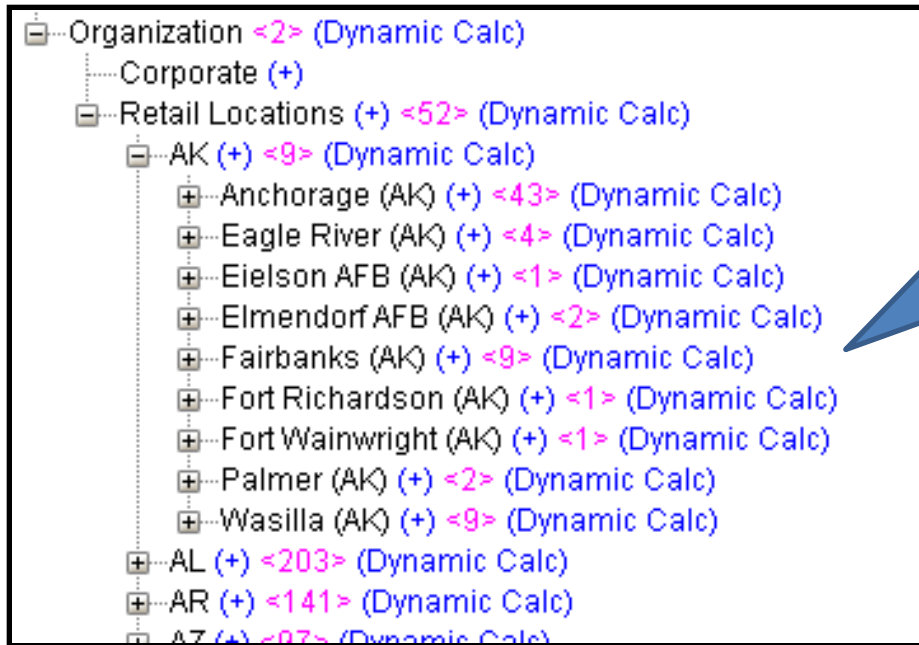

SETTING	DESCRIPTION
None	Disables Hybrid Aggregation Mode (default).
Partial	Enables Hybrid Aggregation Mode, but only for certain outline aggregations (+, -, ~). Everything else fires in Block Storage Mode.
Full	Enables Hybrid Aggregation Mode for simple outline aggregations and formulas (many limitations apply).

ENABLING HYBRID AGGREGATION MODE

- Make Upper-Level **Sparse** Members **Dynamic**

Generally regarded as a bad idea with BSO . . . but required for Hybrid.

CURRENT LIMITATIONS

- There are many circumstances in which calculations will not leverage Hybrid Aggregation Mode.
- Essbase will attempt to execute the calculation in **Hybrid Aggregation Mode**, and if it can't, it will default back to **Block Storage Mode**.
- If Essbase tries to execute a large dynamic calculation on a sparse dimension in Block Storage Mode . . . uh-oh.
- It is important to understand the limitations, but also understand that they will change over time with newer releases.

- The following functions are supported when using the **Full** mode setting in the Essbase.cfg file (as of version **11.1.2.3.500**):

- @CHILDREN
- @EXP
- @INT
- @ISMBR
- @MIN
- @MINSRANGE
- @MOD
- @MODE
- @NOTEQUAL
- @POWER
- @RANGE
- @REMAINDER
- @ROUND
- @VAR
- @VARIANCEP
- @VARPER

- **Other Key Items Not Currently Supported:**
 - Time Balance Tags
 - Attribute Calculations
 - Cross-Dims in Formulas
 - Dynamic Calc Members with Formulas that are Target of Transparent Partitions
 - Queries with Two-Pass and One Pass Calcs from Same Dimension
 - XOLAP

- **What works?**

- **Sparse Member with Formula . . . Only References Sparse Members**

- **Dense Member with Formula . . . Only References Dense Members**

- **Sparse Member with Formula . . . References Mixed Members**

(But Dense Members are Stored)

- What conclusions can we draw as of version **11.1.2.3.500**?
 - Hybrid Aggregation Mode shows a lot of promise, but should not be used in a production environment (yet).
 - **Partial** mode makes more sense than **Full** mode given the limitations.
 - Start working with Hybrid Aggregation Mode in a Sandbox environment.

ADDITIONAL CONSIDERATIONS

- **The limitations previously described do not apply to calc scripts that are run in the BSO region of the cube.**
- **Developers are free to write complex calc scripts that make full use of all BSO functions provided they reference stored sparse member combinations only.**

QRYGOVEXECBLK [appname [dbname]] n

- Sets max number of blocks query can retrieve before being terminated

QRYGOVEXEETIME [appname [dbname]] n

- Sets max amount of time a query can execute before being terminated
- Measured in seconds

- **BSO Cube vs Hybrid Cube**
- **Both Cubes Include All Domestic RedBox Locations**
- **Driver Based Calculation + Aggregation**
- **439 Distributors**
- **40,624 Retail Locations**
- **100% Fake Data**

BLOCK STORAGE MODE vs HYBRID AGGREGATION MODE

RESULTS	BSO	HYBRID
Level 0 Blocks	203,120	203,120
Upper-Level Blocks	560,800	0
Seed Budget Time (seconds)	647	632
Trend Revenue (One Location)	0.265	0.264
Aggregation Time (seconds)	13	0
Retrieve Time (seconds)	0.001	0.960
Dense Restructure Time (seconds)	20	5

- Review the logs to ensure calculations are leveraging Hybrid Aggregation Mode.
- Success looks like this:

```
[Thu Nov 13 10:47:31 2014]Local/HYB_RB/redbox/admin@Native Directory/7468/Info(1204002)  
Hybrid Aggregation Mode enabled.
```

```
[Thu Nov 13 10:47:32 2014]Local/HYB_RB/redbox/admin@Native Directory/7468/Info(1020055)  
Spreadsheet Extractor Elapsed Time : [0.807] seconds
```

- Review the logs to ensure calculations are leveraging Hybrid Aggregation Mode.
- Defaulting back to Block Storage Mode looks like this:

```
[Thu Nov 13 10:57:27 2014]Local/HYB_RB/redbox/admin@Native Directory/3136/Info(1204001)  
Hybrid Aggregation Mode disabled for [Bad Account] due to [formulas are disabled by ASODYNAMICAGGINBSO tag].
```

```
[Thu Nov 13 10:58:05 2014]Local/HYB_RB/redbox/admin@Native Directory/3136/Info(1020055)  
Spreadsheet Extractor Elapsed Time : [37.413] seconds
```
